Justification

Justification

Justification for update

We request a transparent amendment to the existing GRACE registration to (1) correct B0/B1 decision thresholds that were carried into the submitted threshold table as fixed values rather than recomputed from the complete validation splits; (2) document the validation-only threshold-selection procedure for the already registered B1-H2 arm, whose numeric thresholds were absent from the original 14-value lock; and (3) replace the B3 demonstration-pair construction and difference-generation procedure with a verified same-function, vulnerable/patched design. The registered Kaggle environment with two Tesla T4 GPUs remains the execution environment for all arms; this update does not request Colab as an alternative platform. This is an amendment to an ongoing study. B0/B1/B2/B2-flip inference outputs and metrics, and a post-hoc reanalysis including validation-selected thresholds and paired bootstrap contrasts, existed before this amendment. B1-H2 validation and test inference were also performed on Colab L4 as platform-deviant exploratory runs. The resulting Colab thresholds (Devign 0.09; ReVeal 0.67) and Colab test inference are disclosed as exploratory and superseded. The complete B1-H2 Kaggle validation census is now finished: Devign selected tau=0.09 (MCC 0.066793, n=2,732); ReVeal selected tau=0.21 (MCC 0.083632, n=2,273). The Devign value coincides numerically with the old Colab value but was independently selected from Kaggle validation records; the ReVeal value differs. No test records, labels or metrics were read for this Kaggle threshold selection. These activi
deviations are disclosed retrospectively; this update does not establish that they w
preregistered before execution or analysis. The original registration and its PDF/ZIP
attachments remain preserved. The revised methods below apply from the actual

Help
